

Enable backup

A good safeguard policy is the key to a resilient infrastructure. Hardware failure, human error or attack: With a well configured backup solution, you make sure you can quickly restore data and maintain activity without interruption.

The activation of a backup can be done by post or through shared profiles. This allows you to define precisely what needs to be protected.

Access:

Main menu > **Profiles**

Steps:

- Select **Profile** or **post** concerned.
- Click **Configure backup**.
- Set the scope of the backup:
 - **Specific files/folders**
 - **Full job backup**
- Choose the **frequency** (daily, weekly or personalized).
- Click **Enable backup**.

Once the backup is active, it automatically runs according to the set schedule, without interrupting the user.
