

Groups

Group management is an essential pillar of administration in Medulla.

Instead of configuring the rights and resources for each user or machine individually, the groups enable the organization to be centralized and common rules to be applied more effectively.

The groups are used to:

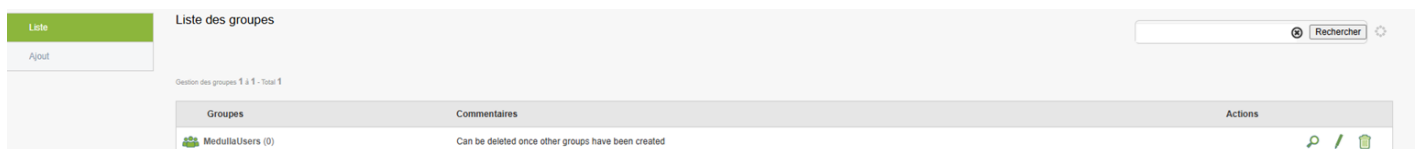

- **Gathering users or posts** functional or technical criteria
- **Implementing common policies** (access, permissions, configurations)
- **Divide roles** coherently
- **Simplifying rights management**, especially in complex environments

This approach facilitates **Global pilotage**, improves **Security** and strengthens the **organisational coherence**.

Unlike Kiosk, which works by individual profiles, the logic of groups in Medulla is designed for a collective and structured management of accesses and configurations.

List of Groups

On the main page of this module you have access to a **full overview of existing groups** in your Medulla environment.

Existing groups

When groups are already created, they are displayed as a table, with the following information:

- **Name of group** : The identifier assigned at the time of creation.
- **Remarks** An optional description of the role or objective of the group.
- **Available actions** :

- **Consult** details of the group
- **Modify** parameters
- **Remove** the group if necessary

Groupes	Commentaires	Actions
 MedullaUsers (1)	Can be deleted once other groups have been created
