

Launch and track deployment

When your packages and rules are ready, you can launch deployment on the targeted machines.

Steps:

1. Side menu → **List of packages**
2. Select Package
3. Click on **Start Action** or **Deployment**

Real-time tracking:

- Progress is visible from the interface
- The machines go back to their condition: Ongoing, Successful, Failed

In case of failure:

- Go to the section **Monitoring of actions**
- See the detailed error report (examples: machine turned off, rights error)
- Correct if necessary, then restart the action without having to start over

Conclusion

With this feature, you can centralize and automate all your software installations and system actions across your fleet. You save time, ensure consistency of positions, and have accurate control over each deployment.
