

# Packages pending deployment

This section allows you to view packages that have been created or added but have not yet been sent to the target posts. It is mainly used to organize, verify or delete pending actions before they are executed.

The screenshot displays the 'Liste des packages en attente' (List of pending packages) interface. On the left, there is a sidebar with navigation options: 'Liste des packages', 'Ajouter un package', 'Liste des packages en attente' (highlighted), 'Liste des règles', and 'Ajouter une règle'. The main area features a search bar with a 'Rechercher' button and a 'Supprimer tous les paquets en attente' button. Below this, a table lists the pending packages. The table has columns for 'Nom du package', 'Description', 'Version', 'OS', and 'Actions'. One package is listed: 'NewPack' with description 'v1', version 'v1', and OS 'linux'. The 'Actions' column for this package contains a magnifying glass icon and a trash can icon. The interface also shows 'Elements 1 à 1 - Total 1'.

Nom du package	Description	Version	OS	Actions
NewPack	v1	v1	linux	 

## Access:

Side menu → **Pending packages**

## Section content:

Once in this page, a list of all queued packages is displayed with the following information for each entry:

- **Name of package**
- **Description**
- **Version**
- **Target operating system**
- **Available actions** (to the right of each line)

## Possible actions:

- **Show state of mirrors** : allows checking the available mirror servers for distribution of the package.
- **Remove pending packages** : button to remove a specific package from the list.
- **Delete all pending packages** : General button at the top of the page to empty the entire queue if necessary.
- **Find a package** : search field to filter the list by name or version.

“

Note: This page does not allow directly to **launch** a deployment, but it helps you control the items still in queue. Deployment is usually done from another dedicated section or via an action triggered through a

scenario or rule.
