

Add a profile

Configuration de démarrage	Ajouter un profil
Menu de démarrage par défaut	Nom du profil <input type="text"/>
Scripts de post-imaging	Description du profil <input type="text"/>
Liste des profils	Ordre des post-installations
Ajouter un profil	Shutdown <input type="text" value="Non sélectionné"/>
Configuration de l'imaging	MountSystem <input type="text" value="Non sélectionné"/>
Gestionnaire de fichiers de réponse sysprep	Check MountSystem <input type="text" value="Non sélectionné"/>
Tous les groupes d'imaging	DebugImaging <input type="text" value="Non sélectionné"/>
Ajouter un groupe d'imaging	Copy agent <input type="text" value="Non sélectionné"/>
	Copy setup complete <input type="text" value="Non sélectionné"/>
	Create folder <input type="text" value="Non sélectionné"/>
	Copy drivers <input type="text" value="Non sélectionné"/>
	Copy sysprep <input type="text" value="Non sélectionné"/>
	Postinstall <input type="text" value="Non sélectionné"/>
	<input type="button" value="Valider"/>

A profile allows you to associate post-installation actions with a master and to add this profile to the machine's boot menu when booting the machine via PXE.

Accessing and editing a profile

From the management interface, you can:

- Add a new profile
- Edit an existing profile
- Delete a profile if necessary

List of available post-installation actions

Here are the actions that can be configured in the desired order.

All are disabled by default; you must select them manually if you wish to apply them:

- **Shutdown:** automatically shuts down the machine once all steps are complete.
- **MountSystem:** mounts the system partitions, useful for accessing certain files before deployment is complete.
- **Check MountSystem:** Verifies that the system has been successfully mounted.
- **DebugImaging:** Enables a diagnostic mode to analyze the imaging process (primarily used by technicians).
- **Copy agent:** Copies the Medulla agent to the computer, required for remote management.
- **Copy setup complete:** adds a file or script to run at the end of the installation.

- **Create folder:** creates one or more custom folders on the computer.
- **Copy drivers:** Copies the necessary drivers to the target machine.
- **Copy sysprep:** installs files related to Windows system preparation (Sysprep).
- **Postinstall:** entry **point** to run a custom script or command once installation is complete.

Using the profile

- Create or modify a profile according to the specific needs of your organization or the target computer.
- Select the desired actions in the appropriate order of execution.
- Associate the profile with a master
- Run this profile when the machine you want to install boots up.

This profile will then be associated with a deployment task, so that the selected steps are automatically applied after installation.
