

Launch a deployment and monitor its execution

Once your packages and rules are ready, you can begin deployment on the target machines.

Steps:

1. Side menu → **Package list**
2. Select a package
3. Click on **Run Action** or **Deploy**

Real-time tracking:

- Progress is visible from the interface
- Machines report their status: In Progress, Success, Failure

In case of failure:

- Go to the **Action Tracking** section
- View the detailed error report (examples: machine turned off, permission error)
- Correct if necessary, then restart the action without having to start over

Conclusion

With this feature, you can centralize and automate all your software installations and system actions across your entire fleet. You save time, ensure consistency across workstations, and gain precise control over every deployment performed.
